Applicators

SILASPRAY®

Data Sheet

SILASPRAY SP Junior

Model Designation:

SILASPRAY SP Junior

For the application of:

liquid biological or chemical silage
inoculants
(no strong organic acids)

Application rates (min. - max.):

- 30-320 l/h
biological/chemical silage inoculant

Technical Data:

electric - 12V DC max 8A

Additional information:

This unit consists of a pump and filter block, a flow meter (max. 320 litres per hour water), tube and nozzles, as well as fixation materials, an electronic control device, and either a suction pipe assembly or containers in different sizes. After fitting the components arrange hoses - by avoiding scouring on moving parts -, connect container/suction pipe to the filter in front of pump, then connect the pump's output to the bottom or to the top of the flow meter, or to the nozzles. After making cable connections from control device to pump (and pickup-switch, if any) and finally to the electric supply system (Attention! Polarity must be correct!), open the valve/cock on the filled container and switch on the system. By rotating the knob on the control device adjust the pump's speed to set the rate of flow (which may be read at the top edge of the flow meter's float). Remember that the nozzle's size must be sufficient for the rate of flow expected. We recommend to mount the container/tank on the tractor's front if working with a baler, over the pick-up in the case of pick-up wagons, or on the cabin's right or on a rear fender in the case of forage harvesters. Fix the flow meter to the cabin's outside so that it is well visible from inside.

Optional accessories:

120 L Tank
200 L Tank
300 L Tank
pick-up switch or relais
